

Model validation and experimental methodology

From survey-informed assumptions to reproducible evidence on malicious news-source strategies.

79 conditions

2,010 seeded runs

Validation scope The current evidence supports software verification, structural output validation, and mechanism-oriented experiments. External predictive validation would additionally require observed exposure and repost data from X; the study should not be described as empirically calibrated.

Arrows show the primary reading path. Common random seeds support paired within-model comparisons; they do not represent uncertainty about a real population.
